

Project Name: Tempest FWI Predictor – A Machine Learning Model to Predict Fire Weather Index

Milestone - 3

The goals were:

To create a web app using flask - I created a web app using flask. Designed an input page where the input features such as temperature, wind etc. are entered to predict the FWI. The app then uses the trained model pickle file to predict the value.

Analysing the dataset a threshold value for FWI to categorize the risk level was found (FWI value =12). Depending upon the FWI value predicted and comparing it with the threshold the app displays the risk level – low ,moderate and high along with the predicted FWI value.
